

# THREAD STEEL ANCHOR BAR

JF-bar anchor uses a reinforcing bar as a load-bearing element, which has a metric thread on one side. JF rod anchors are used in more demanding, steeper terrains, and in the construction of tunnels. It can be installed on earthy and rocky terrain (tunnels, slope stabilization, various fixings). Rock and soil anchoring is a construction technique used to increase and maintain the stability of a rock or soil mass. The installation of anchors as reinforcing elements increases the shear strength of the terrain. In this process, anchors are mainly subjected to tensile load.

## Main applications

Slope protection

Embankment protection

Protection of construction pits

Slope protection combined with nets

Securing the tunnel and creating an open tunnel front.

The rock and soil anchor system can be used in compact and loose soils and rocks.
